stochastic control and optimal stopping problems. The remaining part of the lectures focus on the more recent literature on stochastic control, namely stochastic target problems. These problems are motivated by the superhedging problem in financial mathematics. Various extensions have been studied in the literature.

Abstract—The problem of optimal motion planning and control is fundamental in robotics. However, this problem is intractable for continuous-time stochastic systems in general and the solution is difficult to approximate if non-instantaneous nonlinear performance indices are present.
